

2020

ANNUAL WATER QUALITY REPORT

NEW HOPE SYSTEM

Public Water Supply ID# 1090130

This report reflects water quality testing
conducted during 2020.

Industrial and commercial customers,
should forward this report to their
Environmental Compliance Manager.

BCWSA IS
COMMITTED TO
PROVIDING
CUSTOMERS WITH A
RELIABLE SUPPLY
OF HIGH QUALITY
DRINKING WATER
THAT MEETS OR
SURPASSES STATE
AND FEDERAL
STANDARDS FOR
QUALITY AND SAFETY.

Our water is tested using certified labs that use advanced procedures. We are pleased to share with you this annual report on the quality of your drinking water as required by the Safe Drinking Water Act (SDWA).

This report compiles water quality data based on standards set by the Environmental Protection Agency (EPA) and the Pennsylvania Department of Environmental Protection (PA DEP). Please share this information with other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.

Please take time to review this report. We hope it helps answer questions you may have about the quality of your drinking water, and helps you better understand the care and commitment that goes into providing the highest quality service possible every single day.

Question Box

Have questions or need additional information?
If you have questions regarding this report, please contact:
Erin Rapp

This report contains important information about your drinking water.
Have someone translate it for you, or speak with someone who understands it.

Este informe contiene información importante acerca de su agua potable. Haga que alguien lo traduzca para usted, o hable con alguien que lo entienda.

Ce rapport contient des informations importantes à propos de votre eau potable. Demander à quelqu'un de traduire ces informations pour vous ou discuter avec une personne qui comprend ces informations.

Następujący raport zawiera ważną informację na temat wody pitnej. Proszę poprosić kogoś o przetłumaczenie lub porozmawiać z kimś kto rozumie.

Αυτή η αναφορά περιλαμβάνει σημαντικές πληροφορίες σχετικά με το πόσιμο νερό σας. Ζητήστε από κάποιον να σας τη μεταφράσει, ή μιλήστε με κάποιον που την καταλαβαίνει.

В этом сообщении содержится важная информация о воде, которую вы пьёте. Попросите кого-нибудь перевести для вас это сообщение или поговорите с человеком, который понимает его содержание.

Це повідомлення містить важливу інформацію про воду, яку ви п'єте. Попросіть кого-небудь перекласти вам це повідомлення або поговоріть з людиною, яка розуміє його зміст.

このレポートには飲料水に関する重要な情報が記載されています。この英文を訳してもらうか、またはどなたか英語が分かる方にたずねてください。

此報告包含有關您的飲用水的重要資訊。請人幫您翻譯出來，或請能看懂此報告的人將內容說給您聽。

هذا التقرير يحتوي على معلومات مهمة عن ماء الشرب الذي تستخدمه. اطلب من شخص ما ان يترجمه لك او يستطيع فهمه.

이 보고서에는 귀하의 식수에 대한 중요한 내용이 실려있습니다. 그러므로 이 보고서를 이해할 수 있는 사람한테 번역해 달라고 부탁하시기 바랍니다.

Source of Your Water

BCWSA's New Hope System is supplied by a combination of surface water from the Delaware River and ground water from 5 wells located in New Hope Borough, PA. The water from the Delaware River is treated at BCWSA's Waterworks Water Treatment Plant, which treats an average of 10,000 GPD.

Under Section 1453 of the U.S. Environmental Protection Agency's 1996 Safe Drinking Water Act, states must evaluate all drinking water sources that serve public systems and provide a mechanism for development of local protection programs. In accordance with the Pennsylvania Department of Environmental Protection's Source

Water Assessment and Protection Program (SWAP), a source water assessment has been completed and BCWSA's water treatment plant has been evaluated. The Assessment has found that our source is potentially most susceptible to discharges of treated and untreated sewage and polluted runoff from stormwater. A summary report of the Assessment is available on the Source Water Assessment & Protection web page at www.dep.state.pa.us/dep/deputate/watermgt/wc/Subjects/SrceProt/SourceAssessment/default.htm. The complete Assessment is available for public review at the Southeast Regional DEP office in Norristown, PA.

Help Us Protect Our Source

Protection of our drinking water source is key to sustaining safe drinking water. There's many things you can do to help protect our water and the environment.

- Recycling keeps items from making their way into a body of water.
- Dispose of pharmaceuticals, household chemicals, oils and paint properly. These can impact water ways if poured down drain. Find a local chemical pickup or drop-off location in your area.
- Minimize use of harsh chemicals – they can devastate ecosystems if they reach a body of water.
- Clean up after pets.
- Participate in local watershed activities.
- Report spills, illegal dumping, or suspicious activity.

Facts About BCWSA

Formed in 1962

Non-profit, municipal authority

87,000
customers

500,000
people

Serve 23
townships/boroughs

Over 125
pumping stations

1,200 miles of water
and sanitary piping

3,000
fire hydrants

10 MGD Capacity

BCWSA's New Hope System is supplied by a combination of surface water from the Delaware River and ground water from 5 wells located in New Hope Borough, PA

Substances in Drinking Water

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.

Organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.

Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. We treat your water according to EPA's regulations. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline at 800-426-4791.

Special Risk Populations

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline at 800-426-4791.

Additional Water Quality Information

Delivering high-quality drinking water to our customers is a scientific and engineering feat that requires considerable effort and talent to ensure the water is always there and safe to drink. Because tap water is highly regulated by state and federal laws, water treatment and distribution operators must be licensed and are required to complete on-the-job training and technical education before becoming a state certified operator. Our licensed water operators have an understanding of a wide range of subjects, including mathematics, biology, chemistry, physics, and engineering. Some of the tasks they complete on a regular basis include:

- Operating and maintaining equipment to purify and clarify water;
- Monitoring and inspecting machinery, meters, gauges, and operating conditions;
- Conducting tests and inspections on water and evaluating the results; and
- Documenting and reporting test results and system operations to regulatory agencies.
- Serving our community through customer support, education, and outreach.

So, the next time you turn on your faucet, think of the skilled professionals who stand behind every drop.

Common Water Quality Questions

What is the hardness of my water?

Water hardness is a measure of the concentration of two minerals naturally present in water – calcium and magnesium. Hard water may cause scale buildup in appliances and on fixtures and cookware, and may require using more soap to form a lather. Your hardness level can be found in the data tables in this report.

Water Hardness Scale		
grains per gallon (gpg)	mg/l or ppm	Classification
0 - 1	0 – 17.1	Soft
1 – 3.5	17.1 – 60	Slightly Hard
3.5 – 7	60 – 120	Moderately Hard
7 – 10.5	120 – 180	Hard
10.5 & over	180 & over	Very Hard

What is the pink stain or residue I am noticing?

If you are seeing a pink or reddish slime or stain on fixtures, in the sink or shower, at the toilet waterline, or in pet dishes you are not alone. This coloring is actually from an airborne bacteria, *Serratia marcescens*, that is found naturally in soil, food, and animals. The bacteria is harmless to humans and pets, but can be a nuisance. It thrives on moisture, so to keep the bacteria from growing, clean and dry surfaces frequently and use a chlorinated cleaner to kill them.

Why does my water look cloudy or milky?

One of the most likely causes is trapped air bubbles in the water. This is intensified during cold weather because cold water holds more oxygen than warm water. Fill a clear glass and watch how the cloudiness clears – air bubbles will rise and you will notice the water clearing from the bottom first.

Terms and Abbreviations Used in This Report

The water quality test results in this report may contain terms and abbreviations with which you are not familiar. Here is a quick reference guide to help you better understand unfamiliar terms and abbreviations.

90th Percentile – Represents the highest value found out of 90 percent of the samples taken in a representative group. If the 90th percentile is greater than the action level, it will trigger a treatment or additional requirement that a water system must follow.

Action Level (AL) – The concentration of a contaminant which, if exceeded, triggers treatment of other requirements that a water system must follow.

Alkalinity – A measure of the water's ability to resist changes in the pH level and a good indicator of overall water quality.

E. coli (Escherichia coli) – A type of coliform bacteria that are associated with human and animal fecal waste.

Haloacetic Acids (HAA5) – A group of five (5) chemicals called disinfection byproducts, which form during chlorination.

Level 1 Assessment – A Level 1 Assessment is a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in the water system.

Level 2 Assessment – A Level 2 Assessment is a very detailed study of the water system to identify potential problems and determine (if possible) why an *E. coli* MCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.

Maximum Contaminant Level (MCL) – The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) – The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – Highest level of disinfectant allowed in drinking water. There is convincing evidence that additional disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination.

Nephelometric Turbidity Unit (NTU) – A measure of water clarity.

Not Applicable (NA) – Results are not applicable.

Not Detectable (ND) – Results are below the detection level of the instrumentation.

Picocuries per liter (pCi/L) – A measure of radioactivity.

Parts per billion or micrograms per liter (ppb or µg/L) – One part per billion equals about 1 ounce in 7,500,000 gallons of water.

Parts per million or milligrams per liter (ppm or mg/L) – One part per million equals about 1 ounce in 7,500 gallons of water.

Parts per quadrillion or picograms per liter (ppt or ng/L) – One part per quadrillion equals about 1 ounce in 7,500,000,000,000 gallons of water.

Parts per trillion or nanograms per liter (ppt or ng/L) – One part per trillion equals about 1 ounce in 7,500,000,000 gallons of water.

Total coliform – Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other potentially harmful bacteria may be present.

Total Organic Carbon (TOC) – A measure of the carbon content of organic matter. The measure provides an indication of how much organic material in the water could potentially react with chlorine to form HAAs and THMs.

Total Trihalomethanes (TTHM) – A group of chemicals called disinfection byproducts, which form during chlorination. TTHMs form when natural organic matter decompose and combine chemically with the chlorine added for disinfection. These levels vary seasonally.

Turbidity – A measure of the clarity of water related to its particle content. Turbidity serves as an indicator for the effectiveness of the water treatment process.

Treatment Technique (TT) – A required process intended to reduce the level of contaminant in drinking water.

How to Read and Understand the Data Tables

In order to ensure that tap water is safe to drink, the EPA and PA DEP prescribe regulations that limit the amount of certain contaminants in water provided by public water suppliers. The tables that follow list all of the drinking water contaminants that were detected during the 2020 calendar year. The presence of contaminants in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the data is from testing done January 1 – December 31, 2020. The state requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently.

In general, drinking water standards are regulated by a maximum contaminant level (MCL) or a treatment technique (TT). For parameters with an MCL, we must sample at the required frequency and results must be below the MCL. Depending on the parameter, the MCL may apply to individual results, an average of all results in

a calendar year, or an average of all results in a calendar year for a specific site. For parameters with a TT, we must sample at the required frequency and are required to take action (such as a change in treatment) if specified conditions are not met. Specified conditions vary per regulation.

Beginning with the **Contaminant** column, read across. **MCLG** is the goal level for that contaminant (goal may be set lower than MCL). **MCL** shows the highest level of contaminant allowed. **Level Detected** represents the measured amount in your water. **Range** will give you the lowest and highest amounts measured. The **Sample Date** will be the year the samples were collected. The **Violation** column will tell you whether the result met government requirements. **Typical Source** tells where the substance usually originates.

List of Contaminants Not Detected

Below is a list of compounds that were tested for but not detected:

Volatile Organic Chemicals

1,1,1-Trichloroethane
1,1,2-Trichloroethane
1,1-Dichloroethene
1,2,4-Trichlorobenzene
1,2-Dichlorobenzene
1,2-Dichloroethane
1,2-Dichloropropane
1,4-Dichlorobenzene
Benzene
Carbon tetrachloride
Chlorobenzene
cis-1,2-Dichloroethene
Ethyl benzene
Methylene chloride (Dichloromethane)
Styrene
Tetrachloroethene (PCE)
Toluene
trans-1,2-Dichloroethene
Trichloroethylene (TCE)
Vinyl chloride
Xylenes, Total

Microbiological Contaminants

Coliform, total
E. Coli

Inorganic Chemicals

Antimony
Asbestos
Beryllium
Cadmium
Cyanide, free
Fluoride
Mercury
Selenium
Thallium

Radioactive Contaminants

Combined Radium

Synthetic Organic Chemicals

1,2-Dibromo-3-chloropropane (DBCP)
2,3,7,8-TCDD (dioxin)
2,4,5-TP Silvex
2,4-D
Alachlor
Atrazine
Benzo(a)pyrene
Carbofuran
Chlordane

Dalapon
di(2-Ethylhexyl) adipate
di(2-Ethylhexyl) phthalate
Dinoseb
Diquat
Endothall
Endrin
Ethylene dibromide (EDB)
Glyphosate
Heptachlor
Heptachlor epoxide
Hexachlorobenzene
Hexachlorocyclopentadiene
Lindane
Methoxychlor
Oxamyl (vydate)
PCBs
Pentachlorophenol
Piclorem
Simazine
Toxaphene

Chemical Contaminants								
Contaminants	MCLG or MRDLG	MCL, TT, or MRDL	Level Detected	Range		Sample Date	Violation	Typical Source
				Low	High			
Chlorine (ppm)	4	4	0.87	0.66	0.87	2020	No	Water additive used to control microbes
Arsenic (ppb)	0	10	5	2	5	2018 & 2020	No	Erosion of natural deposits; runoff from orchards; runoff from glass and electronics production wastes
Barium (ppm)	2	2	0.615	0.044	0.615	2018 & 2019	No	Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits
Chromium (ppb)	100	100	1	ND	1	2018 & 2019	No	Discharge from steel and pulp mills; erosion of natural deposits
Nickel (ppm)	NA	NA	0.004	NA	NA	2020	No	No information available
Nitrate (ppm)	10	10	2.33	0.95	2.33	2020	No	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits

Arsenic Advisory

While your drinking water meets EPA's standard for arsenic, it does contain low levels of arsenic. EPA's standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. EPA continues to research the health effects of low levels of arsenic which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

Nitrate Advisory

Nitrate in drinking water at levels above 10ppm is a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity. If you are caring for an infant, you should ask for advice from your health care provider.

Disinfection Byproducts								
Contaminants	MCLG or MRDLG	MCL, TT, or MRDL	Level Detected	Range		Sample Date	Violation	Typical Source
				Low	High			
Haloacetic Acids (HAA5) (ppb)	NA	60	3.18	2.69	3.35	2020	No	By-product of drinking water chlorination
Total Trihalomethanes (TTHMs) (ppb)	NA	80	17.2	11.8	21.9	2020	No	By-product of drinking water disinfection

Radiological Contaminants								
Contaminants	MCLG or MRDLG	MCL, TT, or MRDL	Level Detected	Range		Sample Date	Violation	Typical Source
				Low	High			
Alpha Emitters (pCi/L)	0	15	3.33	ND	3.33	2016 & 2018	No	Erosion of natural deposits
Combined Uranium (µg/L)	0	30	4.54	ND	4.54	2014 & 2019	No	Erosion of natural deposits

Entry Point Disinfectant Residual								
Contaminants	Entry Point	Minimum Disinfectant Residual	Lowest Level Detected	Highest Level Detected	Sample Date	Violation	Typical Source	
Chlorine (ppm)	101	0.20	0.81	1.63	2020	No	Water additive used to control microbes	
	102	0.40	0.40	1.12		No*		
	103	0.40	0.49	1.42		No		

Total Organic Carbon							
Contaminant	Range of % Removal Required	Range of % Removal Achieved	Number of Quarters Out of Compliance	Sample Date	Violation	Typical Source	
Total Organic Carbon	25 - 35	46 - 60	0	2020	No	Naturally present in the environment	

Note: Total organic carbon (TOC) has no health effects. The disinfectant can combine with TOC to form disinfection by-products. Disinfection is necessary to ensure that water does not have unacceptable levels of pathogens. By-products of disinfection include trihalomethanes (TTHMs) and haloacetic acids (HAA5) which are reported elsewhere in this report.

Lead and Copper — Samples are collected from consumers taps, 90 th percentile reported							
Contaminants	MCLG	AL	Level Detected	Sample Date	# Samples Exceeding AL	Exceeds AL	Typical Source
Lead – AL at consumer taps (ppb)	0	15	2.9	2019	0 out of 11	No	Corrosion of household plumbing systems; erosion of natural deposits
Copper – AL at consumer taps (ppm)	1.3	1.3	0.208	2019	0 out of 11	No	Corrosion of household plumbing systems; erosion of natural deposits

Additional Information for Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. BCWSA is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 800-426-4791 or at www.epa.gov/safewater/lead.

Turbidity						
Contaminant	MCLG	MCL	Level Detected	Sample Date	Violation	Typical Source
Turbidity (NTU)	0	TT = 1 NTU for a single measurement	0.092	2020	No	Soil runoff
		TT = at least 95% of monthly samples ≤0.3 NTU	100%		No	

Giardia and Cryptosporidium

Giardia and Cryptosporidium are microbial pathogens found in surface water throughout the United States. Although treatment by filtration removes Cryptosporidium, drinking water providers cannot guarantee 100 percent removal. The testing methods used cannot determine if the organisms are dead or if they are capable of causing disease. Symptoms of infection include nausea, diarrhea and abdominal cramps. Most healthy individuals can overcome the disease within a few weeks. However, immunocompromised people are at greater risk of

developing life-threatening illness. Immunocompromised individuals are encouraged to consult their doctor regarding appropriate precautions to take to avoid infection. Giardia and Cryptosporidium must be ingested to cause disease, and it may be spread through means other than drinking water.

Monitoring of our raw water source on the Delaware River in 2019 showed the presence of Giardia in 12 out of 20 samples and Cryptosporidium in 5 out of 20 samples collected.

Contaminants	Highest Level Detected	Range of Levels Detected	# Samples Containing Contaminant	Sample Date	Typical Source
Cryptosporidium (Oocysts/L)	1	0 - 1	5 out of 20	2019	Human and animal fecal waste.
Giardia (Oocysts/L)	2	0 - 2	12 out of 20	2019	Human and animal fecal waste.

Violations

Reporting Violation for Entry Point Disinfectant Residual

On October 17, 2020 we were not able to report a minimum chlorine residual to PA DEP for Entry Point 102. Our SCADA System records chlorine residuals on a continuous basis, but on October 14th the system crashed. It was rebooted immediately and began communicating again, however it stopped recording data. This was not noticed until October 18th at which time the system was rebooted and data was again recorded. An operator had been on site and recorded manual readings on October 14th, October 15th, and October 16th and recorded readings, however, an operator did not visit the location on October 17th and record a manual reading. Because of this, we were unable to report a residual for October 17th. SCADA was still communicating and alarm shut-downs were still in place and no alarms or communication issues were noted, indicating there was never a drop in chlorine residual.

Monitoring Violation for HAA5 Replacement Sample

On February 22, 2021 a sample was collected for routine quarterly analysis of HAA5. The laboratory analyzing the sample had a quality control issue which caused the data to be biased high. The sample could not be re-run since it was beyond acceptable hold times, so the laboratory submitted a request to PA DEP to accept the data even though it would have been biased high and none of the results exceeded maximum contaminant levels. This happens occasionally and DEP accepts the data. PA DEP rejected the laboratory's request to accept the data and a replacement sample was immediately recollected. Because the replacement sample was collected in March and not February, DEP issued a violation for a monitoring violation. The laboratory, PA DEP, and BCWSA all agree that the cause of the violation was not the fault of BCWSA, however we are required to notify you of this violation.

Additional Monitoring

Secondary Drinking Water Standards

These are recommended limits on compounds that might pose a nuisance to the customer. These compounds affect aesthetic quality (appearance, taste and odor) but do not pose a health risk.

Contaminants	Recommended Limits or Range	Level Detected
Total Alkalinity		152 ppm
Aluminum	0.05 to 0.2 ppm	< 0.010 ppm
Calcium		72 ppm
Chloride	250 ppm	156 ppm
Color	15 Color Units	< 5 Color Units
Corrosivity	-1 to +1 Langelier Index	0.19 Langelier Index
Foaming Agents (MBAS)	0.5 ppm	< 0.05 ppm
Hardness	50 to 250 ppm	76.0 ppm
Iron	0.3 ppm	< 0.100 ppm
Magnesium		33.3 ppm
Manganese	0.05 ppm	< 0.010 ppm
Odor	3 TON	< 1 TON
pH	6.5 to 8.5	7.20
Sodium		26.7 ppm
Sulfate	250 ppm	14.4 ppm
Total Dissolved Solids	500 ppm	516 ppm
Zinc	5 ppm	0.037 ppm

Per- and Polyfluoroalkyl Substances (PFAS)

PFAS are a group of man-made chemicals used in many consumer products, including food wrappers, fabrics, and carpets, to make them resistant to water, oil, grease, stains, and heat. Certain types of firefighting foam may contain PFAS. The EPA has developed a health advisory level (HAL) of 70 parts per trillion (ppt) for the sum of perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS) combined, but has not yet established regulatory limits for compliance by public water suppliers. Because of concerns about PFAS contamination in the region, BCWSA tested each of its entry points for PFAS in 2019. Results from that testing are in the table below. Additional information can be found on EPA's website at www.epa.gov/pfas.

Entry Point	PFOS (ppt)	PFOA (ppt)	PFOS + PFOA (ppt)
EP101	16	7.0	23
EP102	2.4	5.9	8.3
EP103	24	11	35

Water Conservation Tips

Did you know that the average U.S. household uses approximately 400 gallons of water per day or 100 gallons per person per day? Luckily, there are many low-cost and no-cost ways to conserve water. Small changes can make a big difference – try one today and soon it will become second nature.

- Take short showers – a 5 minute shower uses 4 to 5 gallons of water compared to up to 50 gallons for a bath.
- Shut off water while brushing your teeth, washing your hair and shaving and save up to 500 gallons a month.
- Use a water-efficient showerhead. They're inexpensive, easy to install, and can save you up to 750 gallons a month.
- Fix leaky toilets and faucets. Faucet washers are inexpensive and take only a few minutes to replace. To check your toilet for a leak, place a few drops of food coloring in the tank and wait. If it seeps into the toilet bowl without flushing, you have a leak. Fixing it or replacing it with a new, more efficient model can save up to 1,000 gallons a month.
- Adjust sprinklers so only your lawn is watered. Apply water only as fast as the soil can absorb it and during the cooler parts of the day to reduce evaporation.
- Teach your kids about water conservation to ensure a future generation that uses water wisely. Make it a family effort to reduce next month's water bill!
- Visit www.epa.gov/watersense for more information.

Customer Participation

Residents can help ensure the safety of our water supply by reporting any suspicious activities near any water tank, reservoir, or hydrants to our office at 215-343-3946, 24 hours a day, 7 days a week.

The Board of Directors of BCWSA meets on the second Tuesday of each month at 8:30am and the fourth Monday of each month at 7:00pm in the public meeting room at the Authority office located at 1275 Almshouse Road in Warrington, PA. Please feel free to attend and participate in these meetings.
